- Model rows: 783
- Models: nemotron-3-super-120b-a12b, openai/gpt-oss-120b, qwen/qwen3.5-397b-a17b

Statistical Decision Rule

- Alpha: 0.05
- Classification rule: significant / non-significant only.
- Significance uses adjusted p-values when available; raw p-values are explicitly marked as unadjusted.

Significant Results Only

- This section contains only statistically significant findings.
- Decision rule: alpha = 0.05, using adjusted p-values when available.
- AI-vs-Non-AI claims here are only cross-model gap-difference tests (interaction tests), not within-model preference tests.
- Significant findings: 185

Score Model Comparisons

Caveats

- P-values indicate evidence against the null; they do not measure practical effect size on their own.
- Mixed-effects and non-parametric fallbacks are inferential models and do not prove causation.
